Guide: Backup & Security

Render-finished notification

Get a native macOS alert automatically when the DaVinci Resolve render queue finishes (Done/Failed/Canceled) — useful for renders that take hours, so you don't have to sit by the Mac waiting.

- Turn on the main switch for the native notification (appears like any regular macOS alert).
- Additionally check "Also send by email" so the alert reaches your phone too — fill in SMTP Server, Port, Sender email, Password and Recipient.
- Recommended: use an "app password" for Gmail/Outlook, NOT your real account password — the password is saved locally, in plain text, on this Mac.
- Tap "Generate Gmail password"/"Generate Outlook password" for guided instructions to create that dedicated password.
- "Send test email" confirms everything is configured correctly before you rely on it for a real render.

Media Pool Auditor

"Scan current project" reads (read-only, changes nothing) the project currently open in DaVinci Resolve and flags clips whose source files no longer exist on disk (offline media) or that appear more than once in the Media Pool (duplicates) — useful before a backup or project handoff, so you don't discover missing media only at final render.

LUT & Fusion sync across workstations

Upload or download LUTs and Fusion macros/templates/scripts through an already-configured Cloud account (from the Cloud Manager module) — useful if you work across multiple workstations and want the same preferences everywhere.

- Check which categories to sync: LUTs (.LUT), Fusion — Macros, Fusion — Templates, Fusion — Scripts.
- Pick the Cloud account (already added in Cloud Manager) and the direction: "Upload to Cloud" or "Download from Cloud".
- Tap "Sync".

PowerGrades are NOT included here — they live in Resolve's internal project database, not as separate files on disk.

Project database backup

Saves a full .zip copy of the DaVinci Resolve project database (settings, color, structure — not the media itself).

- Check the real database size, shown directly on screen.
- Tap "Backup now" — the .zip archive is saved locally.

Very important: close DaVinci Resolve BEFORE backing up — a "hot" copy, with Resolve open and the database active, can corrupt the resulting archive.

Stuck Resolve process (zombie)

The app automatically checks for a stuck DaVinci Resolve process (running in the background but with no visible window — typical after a crash) and offers a force-quit button, so you don't have to manually open Activity Monitor.

Security & Privacy — what each check means

- FileVault (disk encryption) — encrypts the whole system disk; without it, anyone who physically removes the disk from the Mac can read the data directly.
- System Integrity Protection (SIP) — protects critical system files from modification, even with administrator rights; disabling it significantly weakens overall Mac security.
- Gatekeeper — checks the digital signature of any app before its first launch, blocking unsigned/unknown software.
- Firewall — blocks unsolicited network connections to your Mac.
- XProtect — Apple's native, silent antivirus; checks every downloaded file against known malware signatures.
- Password immediately at screensaver — requires the password AS SOON AS the screensaver starts, not after a delay — prevents unauthorized access if you leave the Mac unattended for a few seconds.

One-click quick actions

- "Enable Firewall + Stealth Mode" — turns on the firewall AND makes the Mac invisible to network pings/scans, in one tap.
- "Require password immediately at screensaver" — sets the delay to 0 seconds, automatically.

What is NOT done automatically, and why

Disabling FileVault (requires manual recovery-key confirmation), disabling System Integrity Protection (requires restarting into Recovery Mode, a deliberately heavyweight process by Apple), and configuring DNS/VPN/Tor (a strictly personal choice, with no universal "correct" answer) remain decisions made directly in System Settings — never from a single button in this app. The risk of locking yourself out or exposing the Mac without realizing it is too high for an automatic action.
